

WEB DEVELOPMENT PRATICAL

1. Practical : Project Initiation, Requirement Analysis, Sitemap, Wireframe, and GitHub Setup

LEARNING ABOUT SITEMAP , WIREFRAME , USER ROLE , NAVIGATION FLOW , KEYMODULES , PROBLEM SCOPE , GITHUB AND GIT , REPO : ALSO ANALYSING FEW THINGS

So in first practical sir gave us to analyse the above things by ourself and this is what I have learnt and got to design wireframe using figma.

SITEMAP: A sitemap is the structure of the website. It shows all the pages in the website and it's connection with each other.

WIREFRAME: A wireframe is a basic layout or blueprint of the website.

USER ROLE: The main user of this portal is students and later on faculty would also be added

NAVIGATION FLOW: The navigation flow shows how users move from one page to another. It is controlled using <A> tag which links the pages.

PROBLEM SCOPE: Students including me have struggle with constant visits of councilor for approval of certificate , events attendance, request for leave, informing about attending a event therefore with all the basic facilities and included these problems.

GITHUB AND GIT: Github is a platform for version control and keeping a track of your projects and git is a version control system used to keep track of changes made to the project.

REPOSITORY: A repository is the folder where all the project files are there.

URL: A URL (Uniform Resource Locator) is the address of a webpage on the internet.

Example of url and it's part :

Github commit : when you press commit it uploads and save changes to your file in github.

HTML: Hyper Text Markup Language – used for designing web pages

How is an html file processed: so each website has it's domain name through which it is commonly known and there is url through which it sends request to DNS and the server loads the pages and the html and css style is applied. The webpages are given to the particular application using IP.

Mistake made: Not designing the work early and coming up to a conclusion

Practical 2: Semantic HTML5 Pages with Accessibility-Ready Structure

HTML5: it provides meaningful tags which includes their meaning clearly and their purpose.

Key Questions / Analysis

/ Interpretation

The navigation tags I have used are header , footer , section , main ,navigation .

2. Are form labels, headings, image alt text, and navigation links

Accessible: I have tried to make it as accessible as I could.

3. Is the page structure consistent across all pages: yes

Mistakes: The page is not that interactive and used only basics html tag , used only few tags. Didn't involve FAQ and feedback.

Struggle to start and actual implement at first and used chatgpt for help even after learning about the tags

Tags

- <nav>.
- <headings>
- <p>
-
- <hr>
-

- <a>
- <form>
- <label>
- <input>
- <button>
- <table>
- <tr>
- <th>
- <td>
-
-
- <select>
- <option>
-
- <center>

Input types

- text.
- password
- checkbox
- submit
- reset
- button.

Attributes

- href
- src
- alt
- width
- height
- type
- value
- border
- rel

Practical 3: Responsive UI Design using CSS Grid, Flexbox, and Bootstrap/Tailwind

What I have learned: I have learnt to design with basic css for my website which included of :
